

COMPANY XYZ REPORT

Olivia and Margherita

PERCENTAGE OF NUMBER OF SALES IN EACH

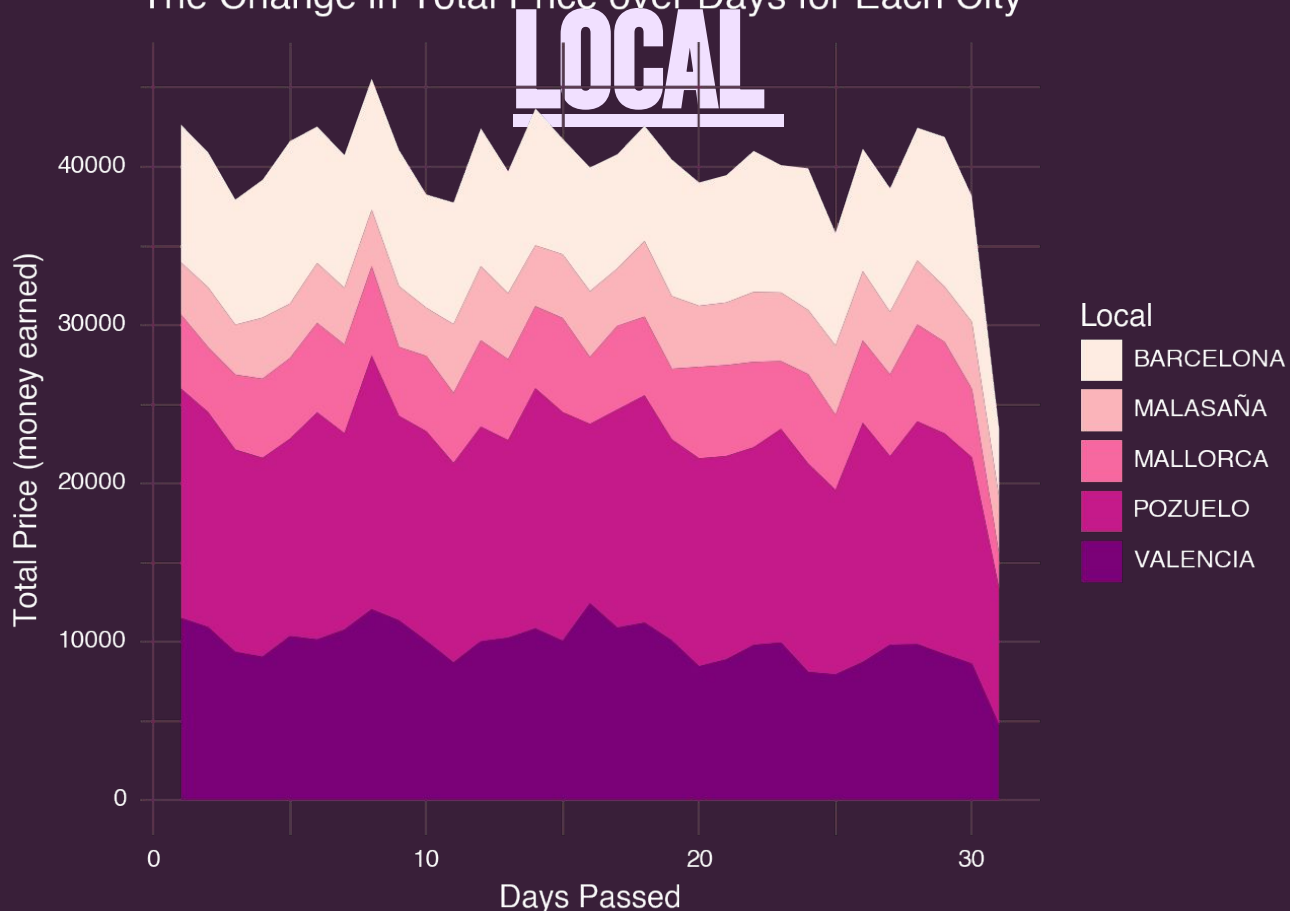

PERCENTAGE OF NUMBER OF SALES IN EACH

LOCAL

- Valencia and Pozuelo are the branches performing the highest, with the highest percentage of sales occurring in those locales.
- Malasaña is the lowest
 - company could put more effort to increase this sector
 - If the company is currently utilizing similar marketing strategies across all locales, they could diversity their promotional mix to better target the Malasaña market
 - or close the branch and divert the resources to other locales
 - Possibly to Valencia and Pozuelo - they have the highest sales so investment in these has a higher potential return

CHANGE IN TOTAL PRICE OVER DAYS PER

The Change in Total Price over Days for Each City

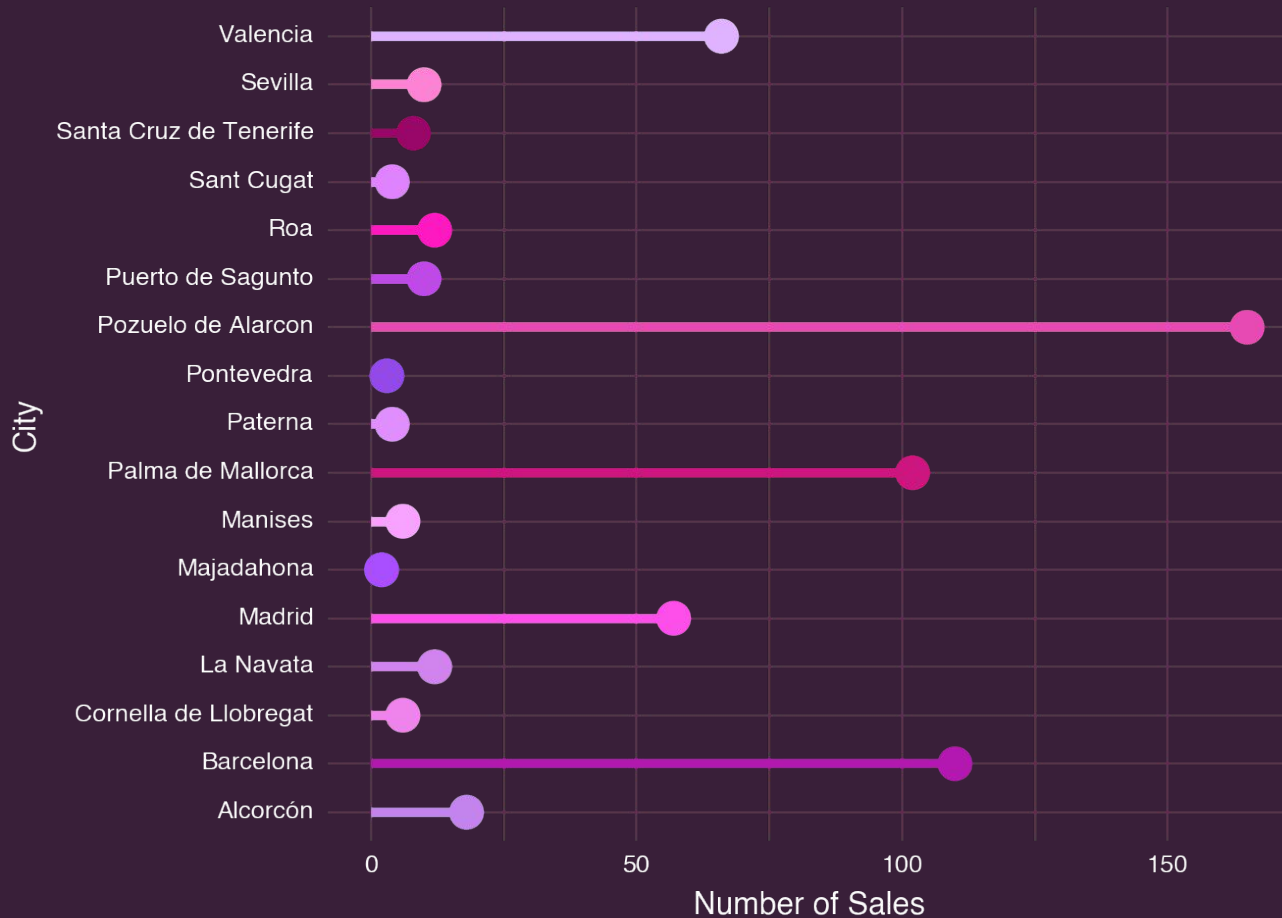

CHANGE IN TOTAL PRICE OVER DAYS PER

LOCAL

- The total price represents the transaction amount - so how much money a customer spent.
 - This indirectly measures how much money
- Peak around day 8 across all locales
 - Means that more transactions occurred on this day
 - Perhaps a popular day for customers, therefore the company could take advantage of this by having promotional deals
- Dip at around 25th of the month
 - Perhaps a slow day for customers
 - Increase promotion on this day to attract more customers to not have a dip
- Valencia's prices fluctuate less- indicating the marketing strategies utilized there are more stable
 - If company XYZ wishes to increase their stability they could replicate Valencia's strategies

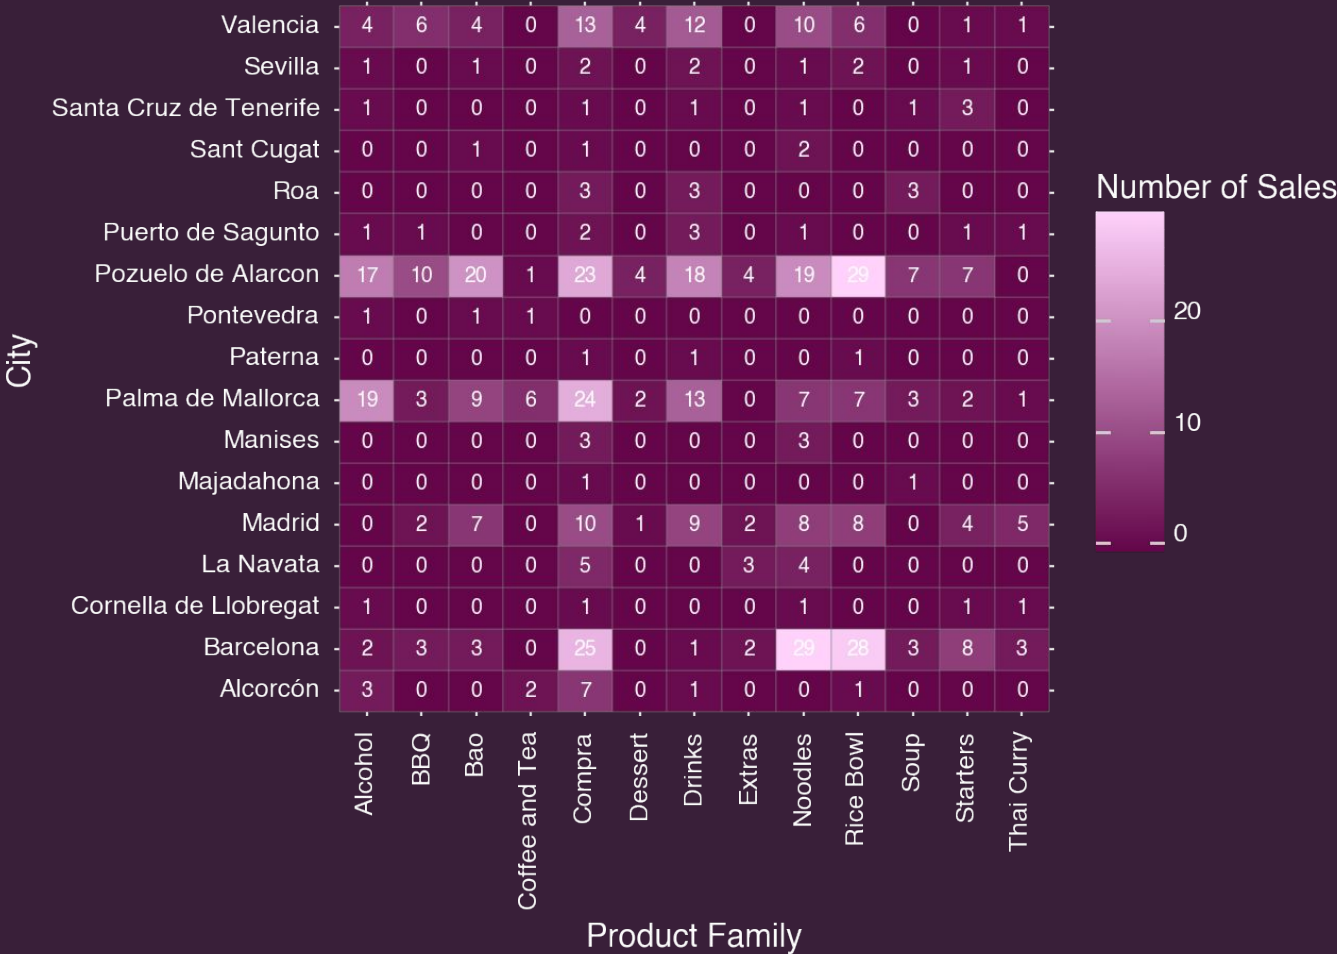

NUMBER OF SALES PER CITY

NUMBER OF SALES PER CITY

- Pozuelo de Alarcón, Barcelona, Palma de Mallorca, and Valencia are the top performing cities in terms of number of sales.
- Pontevedra, Majadahonda, Sant Cugat, and Paterna are the lowest performing cities.
- Provides a deeper evaluation to the initial pie chart; the original only identifies the overarching local, whereas this lollipop chart specifies the city.
- This plot allows the company to further tailor their marketing strategies within each local, analyzing which specific cities need more assistance and which cities are thriving.

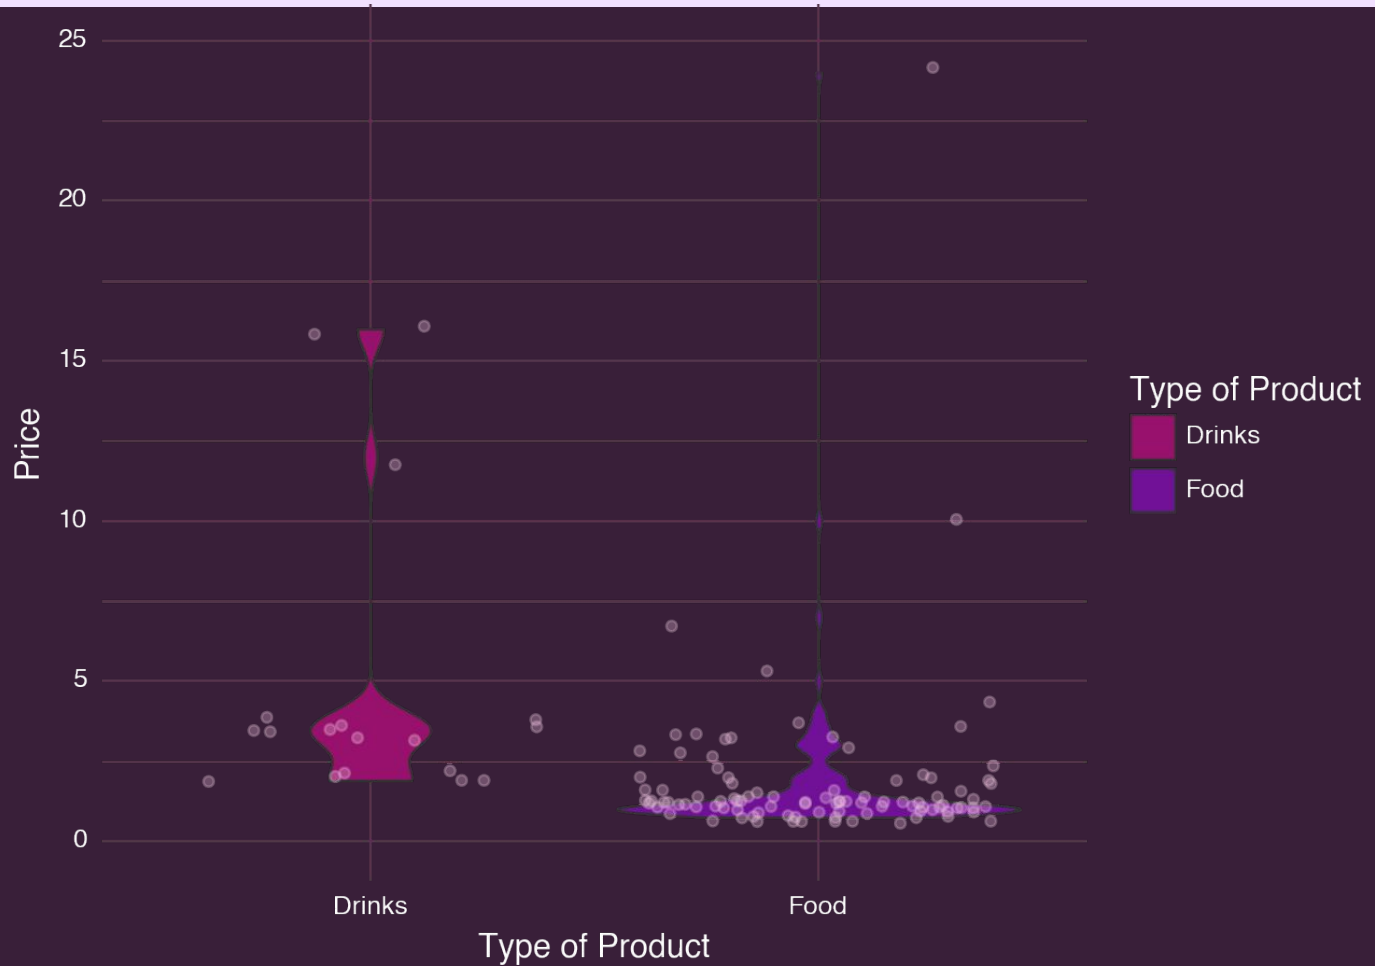

NUMBER OF SALES PER CITY AND PRODUCT FAMILY

NUMBER OF SALES PER CITY AND PRODUCT FAMILY

- Presents a deeper analysis of the lollipop graph by comparing the number of sales per city along with the product family
- The Rice Bowl and Noodles are the items that are the most popular overall
 - And specifically in Pozuelo de Alarcón and Barcelona these two products are the maximum sold items overall.
- Coffee and Tea, Desserts, Extras, and Thai Curry are items that are very rarely bought. If the company incurs costs that are too high, they can consider removing these items from the menu to maintain stable profits.

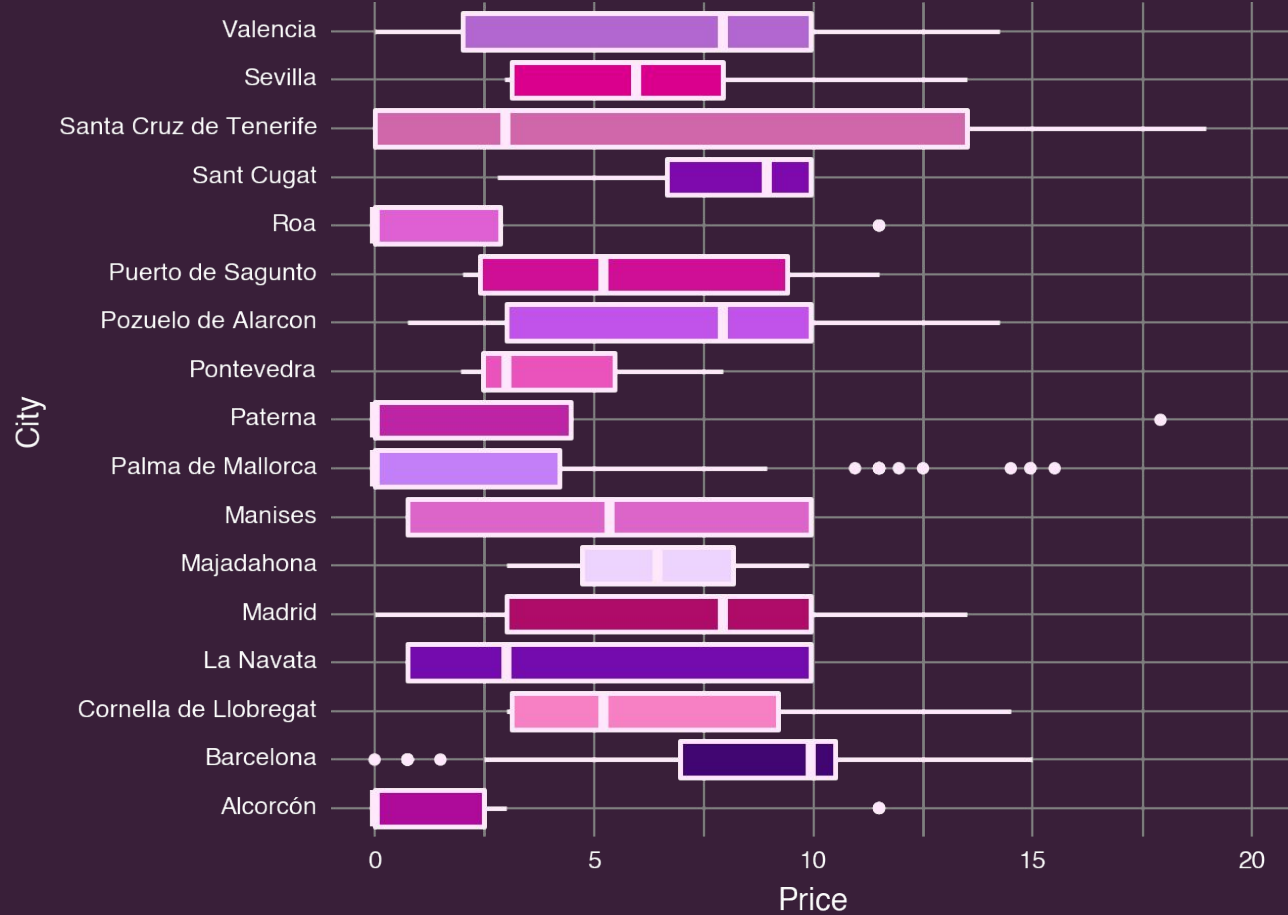

DISTRIBUTION OF PRICE PER PRODUCT TYPE

DISTRIBUTION OF PRICE PER PRODUCT TYPE

- The food category has more data points - indicating people tend to buy food more than they do drinks.
 - If the company wishes to increase drink sales, they can add special promotional deals - such as buy one get one free! - to increase customer awareness.
 - This could be beneficial as the drinks category has data at higher values, meaning that an individual drink can be sold for a higher price.

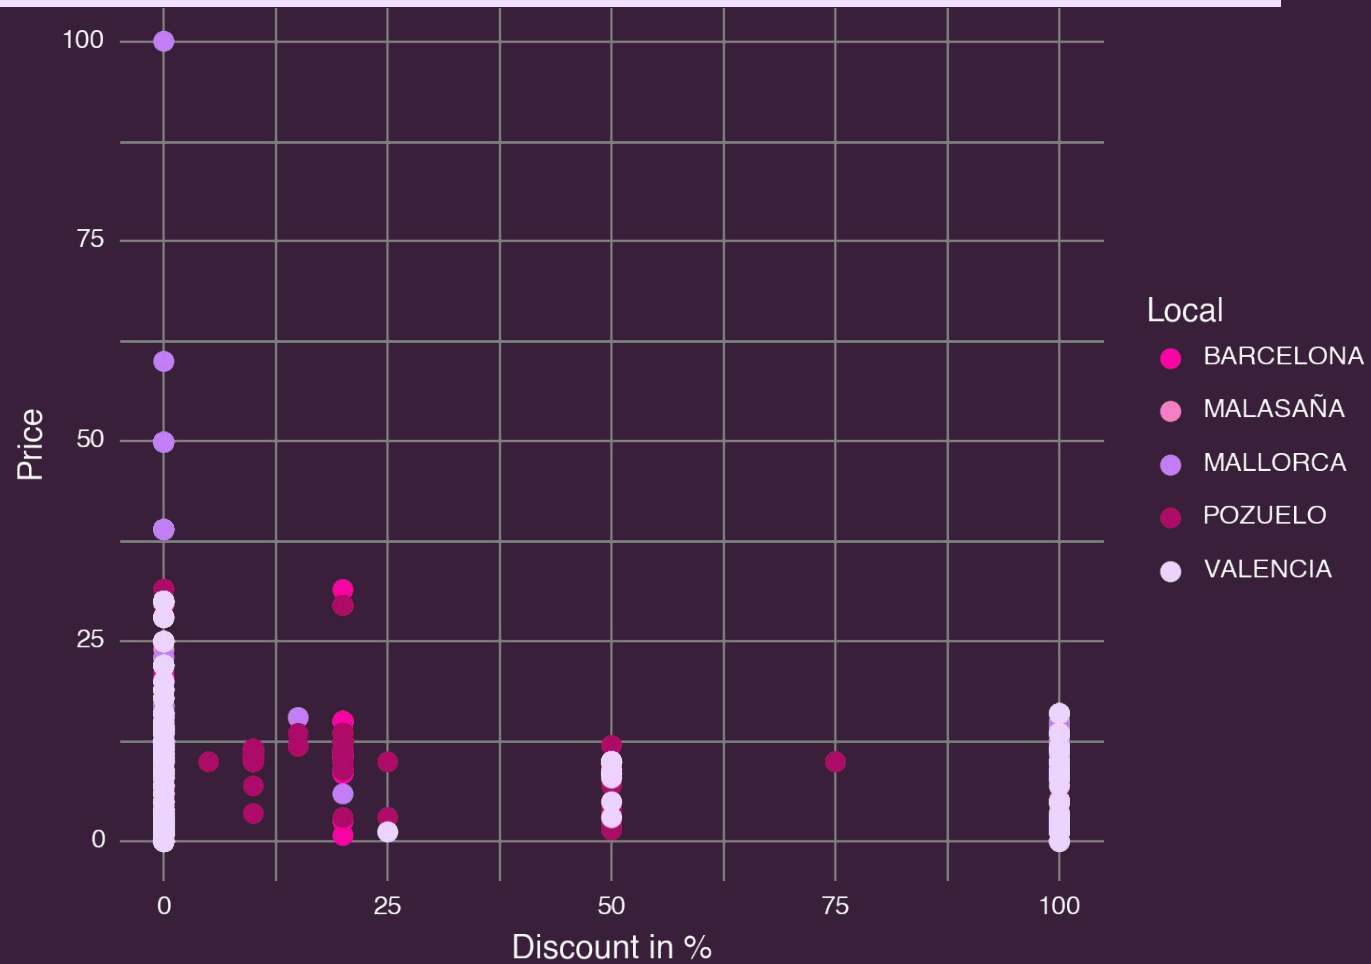

PRICE DISTRIBUTION PER CITY

PRICE DISTRIBUTION PER CITY

- Santa Cruz de Tenerife, Valencia, and Manices have very distributed data - meaning that the price on their menus varies a lot, or the number of transactions that they get varies
 - They are not “stable” restaurants in the sense that their customers do not spend money consistently
 - Their marketing strategies need to focus on retention of clientele
- In Alcorcón and Roa, the prices are not very distributed and they tend to be very low.
 - The clientele may not be enjoying the locale, indicating the restaurants in these locations could divert more resources in the ambiance of the restaurant.
 - Could increase time of stay of each customer thus potentially increasing the number of items bought

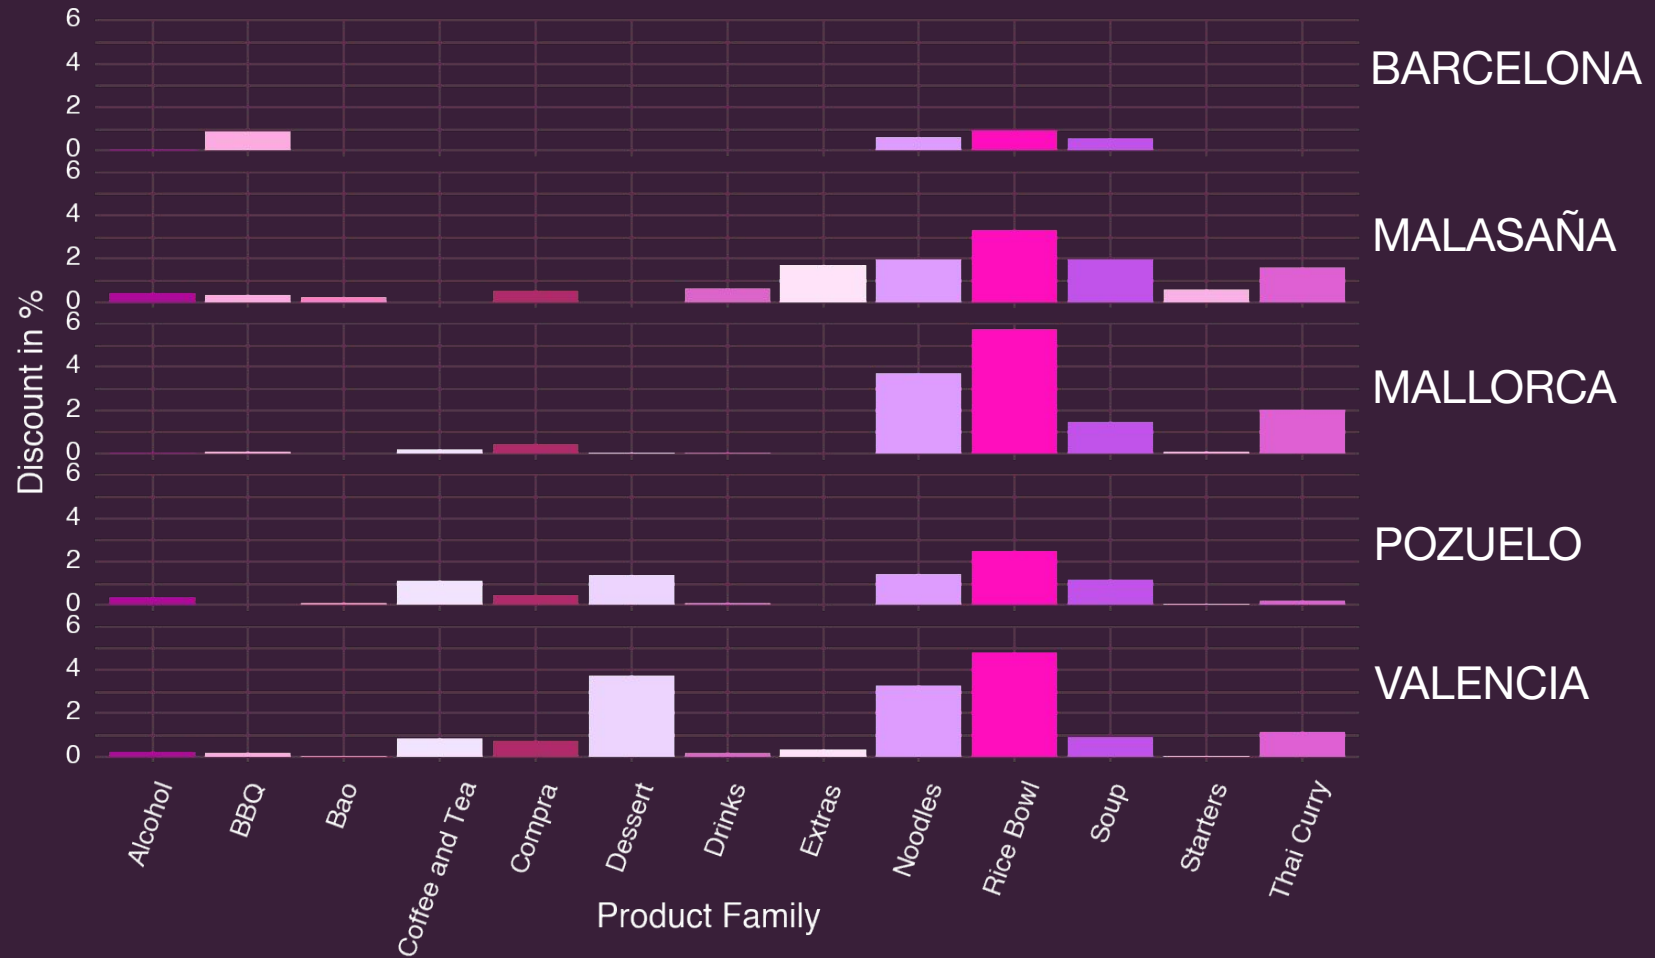

DISCOUNT VERSUS PRICE PER LOCAL

DISCOUNT VERSUS PRICE PER LOCAL

- Valencia and Pozuelo have the highest number of discounts of all the locales - which could explain why they are the locales with the highest percentage of sales (pie chart)
- Malasaña has very little discounts, and it is the locale with the lowest percentage of sales
 - This indicates that discounts are very important to the customer base of this restaurant, and that to increase sales more discounts should be applied.

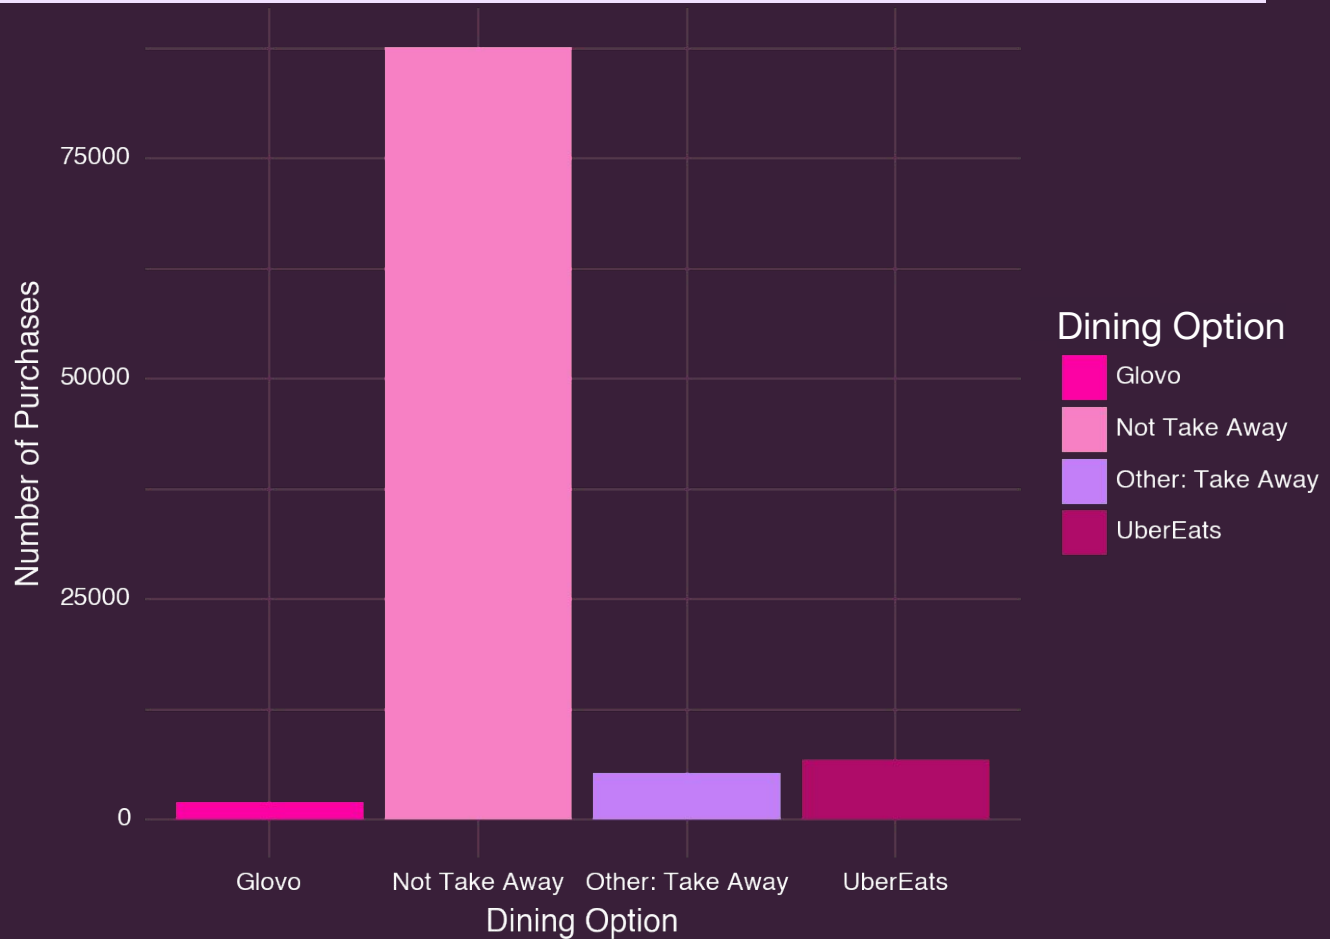

DISCOUNT PER PRODUCT FAMILY AND LOCAL

DISCOUNT PER PRODUCT FAMILY AND LOCAL

- The noodles and the rice bowl have the highest discounts
 - This confirms the suspicion that discounts are the driving force in purchasing behaviour, as the noodles and rice bowl are also the most frequently bought dishes (heat map)
- Again, Valencia and Pozuelo have the highest levels of discounts.
- The soup and the Thai curry have high discounts across all locals but are not frequently bought dishes (heat map).
 - This suggests that the increase in discounts does not seem to help in popularizing the items and they may want to try other tactics.
- Malasaña has discounts across a variety of products - despite being one of the lower performing regions.
 - The discounting is not a factor that helps increase sales, thus different tactics for increasing sales should be utilized.

OVERALL COUNT OF DINING OPTIONS

OVERALL COUNT OF DINING OPTIONS

- The majority of customers prefer the not takeaway or dine in dining option.
 - This means that the ambiance and setting of the restaurant is very important, as the majority of customers are going to sit and eat.
- The takeaway and delivery options are not very popular among the customers
 - If the company is at a point where they need to cut costs, they can consider removing the delivery options from their restaurant as it will not greatly decrease their sales.
